

## Keep active with Oticon hearing aids

Hearing well on the sports field, in the gym, while cycling your favourite route or just enjoying a walk through the park, can make a big difference to one's enjoyment of physical activities. Young and old alike can use their hearing aids with confidence thanks to Oticon's innovative design and advances in technology.

### Never miss a goal

It's important to hear the environment around you as well as the people you're with when exercising or playing sport.

- **Speech Guard** amplifies all sounds so that they are both clear and comfortable, and ensures that the speech details, typically diminished by traditional amplification systems, are preserved.
- **Wind Noise Manager** automatically reduces wind noise in between words 500 times every second, by up to 30dB.
- Traditional noise reduction systems close down the sound environment so you can only hear one person at a time. **OpenSound Navigator** is different. It reduces unwanted background noise while preserving speech in 360 degrees.

So you can hear your teammates, whatever the weather and wherever they are around you!

### Run, jump, do somersaults...with confidence and no whistling!

Hearing aid whistling is a big annoyance for some hearing aid users, and a barrier to getting active. Traditional feedback cancellation systems still end up reducing the amplification to reduce the whistling, which is no good for hearing what's going on around you.

**OpenSound Optimiser** proactively eliminates feedback without reducing amplification, so you can do those somersaults *and* hear your coach...with confidence.

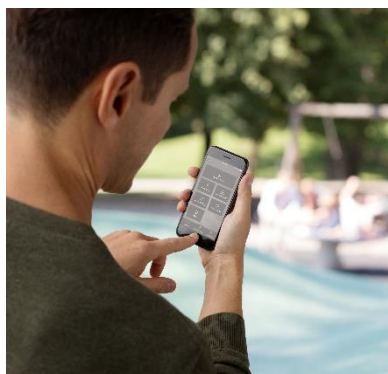

## What about dust and water?

Oticon hearing aids are **IP68 certified**, which means they are dust proof and highly resistant to water ingress. Essential for an active lifestyle!

For even greater protection of your hearing aids, **Ear Gear** offer snug little covers for hearing aids. Ear Gear are supplied in the UK by Connevens. [www.connevens.co.uk](http://www.connevens.co.uk)

## For extra peace of mind

Hearing aids should always be fitted by your hearing care professional so that they fit securely on your ears. If you're still concerned about them falling out, **Oticon SafeLine** can give you added peace of mind. **SafeLine** anchors the hearing aids to your collar so even if they fall out they aren't lost.

In the very unlikely event that you do lose your hearing aids, the **Find My Hearing Aids** feature in the **Oticon ON app** can help you find them. The app uses your phone's location services to track the geolocation of the hearing aids. When phone and hearing aids are separated, the feature will show you the last known location of the hearing aids on a map.

## Need extra focus over a longer distance?

Some sports involve listening to a coach or instructor over a longer distance. This can present a challenge for tiny hearing aid microphones, especially outdoors. **EduMic** is a neat, discreet wireless microphone that pairs seamlessly with Oticon hearing aids. Give the EduMic to the coach and have their voice streamed wirelessly directly into your hearing aids.
